1   ABSTRACT

2   A system and method for treatment of neurological disorders with sound therapy

3   is disclosed. The system can have a local PDA, a remote server, a physician's PC, and a

4   database connected to the server. The PDA and PC can be networked with the server.

5   The PC can initialize a treatment protocol stored at the server. The server can utilize the

6   database and the protocol from the PC to come up with a recommended therapy. The

7   recommended therapy can be selected by the PC and sent to the PDA. The PDA can then

8   execute the selected therapy on the patient. The PDA can also record biometric and other

9   feedback and send it to the server.
